**Haywood LJ. Editorial Comment: Left Bundle Branch Block in Acute Myocardial Infarction: Benign or Malignant? J Am Coll Cardiol 2005;46:39–41.**

The first sentence of the first paragraph in the left column on page 40 should have read:

Using a criterion of twice the upper limit of normal value for serum CK-MB as the ‘gold standard’ for confirmation of myocardial injury, the investigators in the Wong et al. (19) study demonstrate a high specificity for the criteria  $>1$  mm elevation in any lead or ST-segment depression in  $V_1$  through  $V_3$ , but low sensitivity and low specificity for  $\geq 5$  mm discordant ST-segment elevation in any lead.

The author regrets this error.
